

# Image: WebP, Compress, Zoom, Lazy load, Alt &More

**Greatly improve your website speed by compressing images, using google WebP format, Lazy Load for ALL images and your SEO by dynamically generating alt tags for your images.**

## Requirements:

- The module requires at least PHP 5.6 to work properly
- GD or Imagick php library with WebP support is recommended, it's not enough to have them installed if you they do not have webp support, Imagick is recommended over GD as GD library does not support transparency.

## Recommendations:

Make sure that your files/folder have writing permissions

The external service used is FREE and everything is already setup and integrated with their API so you do not have to do anything.

The lazy load functionality is compatible with most themes/modules but in extremely rare cases it will not work due to bad written themes or module , we will offer our support to fix/adapt the functionality to the clients needs but we cannot guarantee it will work with badly written themes/modules, and we will not offer a refund if this is the case.

WebP conversion needs php library to support WebP conversion, if your hosting does not allow that, as a fallback method the module will use our internal conversion API which is free, but it's slower - to use it just use the module as you would normally do, it will detect you do not have the necessary extensions installed and it will automatically use the in-house API . We strongly encourage even if you use the WebP conversion with our API to install the required libraries as soon as you can on your hosting.
