Nginx guide

We need to change http section, usually, you can find it in the /etc/nginx/nginx.conf file, add the following config there:

```
http {

  # ...

  map $http_accept $webp_ext {

    default "";

    "~image\/webp" ".webp";

  }

  map $uri $file_ext {

    default "";

    "~(\.\w+)$" $1;

  }

  # ......

}
```

Also, we should make a location for our images in a server section. Usually you can find a server section in the /etc/nginx/conf.d/default.conf file, but it can depend from your basic nginx configuration.

```
server {

  # ...

        location ~* "^(?.+).(png|jpeg|jpg|gif)$" {

        try_files $path$webp_ext $uri =404;
```

```
        }

    # ...

}
```

And finally please ensure that your /etc/nginx/mime.types file contains the following line:

image/webp webp;

If not, you should put it there manually. So nginx will know which Content-Type header it should send for files with .webp extension.
